**Please note:** the above list references the generic model numbers from the manufacture and not the specific build standards. We are aware that some of the devices above have been "out of manufacture" for a number of years and are included in this list due to the large installed base of older Scanner devices. We are also aware that there is a market in re-furbished units where the units have been upgraded. For our application to operate, the device must be as per the manufacture build standard and a list of build standards is available on request.

Where devices are several years old, they will have slower processor and operation. Sites with an average to heavy use may find that the speed of the devices is unacceptable.

Datalinx would always recommend the use of the currently available devices.
